Week 6 | Visual design justification

For the National Grid Authority budget committee: prioritize D12, D11 and D13 on interruptions per 1,000 billed domestic households, rather than the largest district totals. A household denominator expresses service exposure and avoids treating population scale as poor reliability. It is a feeder-interruption count per connection, not a measured probability that a household lost power.

The map uses an equal-area projection because degrees are not area, five quantile classes to compare relative position across 24 districts, and explicit numeric edges below the panel. The companion ranking preserves the exact order hidden by classes. Bars start at zero; no district is suppressed or merged (0). Missing interruption duration in two districts is retained as missing; it does not remove their valid interruption counts. No uncertainty intervals are claimed without a sampling model.

The raw-count counterfactual prioritizes D17, D13 and D24. It would divert attention from D12 and D11. D13 appears on both lists because it has both a large connection base and a high interruption rate. Counts correlate with households at +0.991, but normalized rates at +0.175. The five largest districts hold 59.9% of residents on 12.6% of land, so the ranking accompanies the map to counter geographic ink bias.

Daily peak demand is a level: the trend uses P1 daily MW and a 28-day trailing full-window mean, which reduces noise and breaks at missing readings. Daily meter energy is differenced only across consecutive days, with resets unknown. The brief June anchor uses June 1 to July 1 readings (1,200,239 MWh); the dictionary defines end-of-day readings, making calendar June May 31 to June 30 (1,199,207 MWh). Both are reported rather than silently redefining the month. Generation composition excludes published total rows; Other combines all non-solar parts. April 2025 to September 2026 solar MWh rises 82.1% and share rises 4.1% to 7.9%, while the total falls 5.0%. This supports a real solar increase without concealing denominator contraction.
